Subject: South PM Stack Test

Hi Eleanor,

I spoke with Jeremy from TRC and internally with folks here regarding the potential issues with temperature during the stack test. The method we used isn't reliable over 400 F.

We are planning on testing the temperature at the South plant on Thursday. If the temperature is above 400 F, would it be alright to use Method 5 202? TRC will be prepared to sample with both methods, and we would make the call Thursday after testing the temperature.

Also, do you know who will be providing oversight this Friday and Saturday?

Please give me a call if you need any further clarification.

Thanks so much,

Alina
